

SecurStor Enterprise Edition Data Sheet

DATA PROTECTION

Execute Policies

Systemically – Define your PC backup policies by frequency and file type. Define your data retention requirements by end-user profile. Ensure that file backup, encryption and deletion policies are defined and executed to meet your regulatory requirements and applied across your entire enterprise.

AUTOMATIC PC BACKUP

Frequent Backup –

Transparent, automatic PC backup down to one-minute intervals without end-user set up or intervention.

Backup Scheduling – Set your backups to occur at certain times of day to accommodate lower-rate bandwidth plans.

Document Retention – Store all document version changes for up to 180 days, enabling application of data retention policies by user profile.

Easy Restore – Restore files and recover previous document versions quickly and easily, reducing IT staff time and effort.

File Type Support – Back up and restore all standard data file types such as Microsoft Word, Excel, Outlook PST, Adobe PDF and all other data file types, including files that are open or locked.

Policy Driven PC Backup for the Enterprise

Business has Evolved - The way you do business has evolved. Your employees are more mobile than ever. Your laptops and PCs are more vulnerable to loss, theft and damage. Providing data privacy and mitigating corporate risk are at the top of your IT security agenda.

SecurStor Enterprise Edition delivers the most secure and comprehensive enterprise PC backup and data privacy solution available today by integrating five best of breed components to deliver a higher level of security and privacy, with a lower cost of ownership than individual backup, encryption and data deletion products can offer.

Guard your intellectual property, protect your brand, secure your customers' data and stay compliant with MarketStor.

Reduce Your Risk with Integrated PC Backup, Device Trace and Proactive Data

Deletion - Designed for business and government professionals with sensitive data on their PCs and laptops, SecurStor Enterprise Edition is the only solution that offers highly secure, automatic PC backup with proactive data deletion and device trace in a single, integrated product.

Our unique approach to data deletion ensures selected files can be remotely wiped from lost or stolen devices through either policy enforcement or via a command. You can define a policy to proactively wipe files if a device does not sign on each week; or send a delete command to wipe files from an employee's device if they are being terminated for misconduct.

The file structure deletes from the top level down, transparently in the background, never alerting the culprit to what is happening. And because your files are backed up to the minute, there are no release forms to be signed and no risk of data loss. Your sensitive files can be wiped in the timeframe that you set, significantly reducing your risk of exposure while putting you firmly in control of your data.

SecurStor Features

SecurStor Enterprise Edition Encrypts All of Your Data - Other solutions encrypt data, but not file names and folder structures, even in their encrypted data stores. With file and folder names readable and accessible, private data can be easily captured – violating HIPAA, PCI and other data protection regulations. SecurStor Enterprise Edition encrypts metadata to ensure no private information can be gleaned, enabling you to be compliant with the strictest data privacy legislation.

DATA DELETION

Proactive Data Deletion – Wipe files on a lost or stolen PC either on command over the Internet or through policy management, ensuring your data does not fall into the wrong hands.

Device Tracing – Locate your lost or stolen PC once it connects to the Internet, aiding law enforcement in recovery and prosecution.

ROBUST AES ENCRYPTION

Device-level – 256-bit AES encryption applied to data at the device with cryptographically random keys; data never unencrypted during transport and storage.

Transport-layer – 128-bit Secure Socket Layer (SSL) encryption providing secure data transport.

KEY MANAGEMENT

Simple key management – Patent-pending automated key management and escrow capabilities deliver the security of random generated keys without the typical management complexities.

SecurStor Enterprise Edition Never Unencrypts Your Data - Once encrypted on your PC, your data is never unencrypted throughout the backup and storage processes. Other point solutions unencrypt your data to apply data deduplication for storage economies, leaving your data susceptible to sniffers and spyware. With SecurStor Enterprise Edition, your data remains protected by the highest encryption standards, constantly.

With our patent-pending key management and escrow system, management is as easy with one user or a million users, saving you costly IT resources. And your data stays secure whether you host your SecurStor Enterprise Edition solution in-house or through a service provider.

Centrally Manage Policies to Ensure Compliance, Without Relying on End User Behavior - Once the SecurStor Enterprise Edition has been set up on each PC, you don't need to rely on your workforce to comply with backup procedures. Even the most conscientious employee may only back up daily or weekly, still leaving the possibility of several hours or days of lost productivity. With SecurStor's Enterprise Edition backing up down to the minute, automatically and transparently, you can ensure files are backed up in accordance with your policies, without interfering with your employees' daily work.

To comply with growing data retention and discovery requirements, SecurStor Enterprise Edition allows you to set the PC backup retention period for multiple document versions or for different user groups, such as legal versus sales.

Five Powerful Components - SecurStor Enterprise Edition is engineered as a single code base, offering five powerful components. Point solutions simply cannot offer you the same functionality, ease of management and compelling cost model.

SecurStor's approach to PC data protection provides advantages no other solution can offer. Storage economies across encrypted data, complete data privacy through automated key management and the ability to wipe data from a lost or stolen machine with the peace of mind that it was backed up during the last minute of use. Define and manage your company's data protection policies, then access them via MarketStor's management suite or expose them via Web API's.

All of this adds up to efficiencies in product, management, IT resources and employee productivity that give you data protection at a fraction of the cost of other solutions in the market today.
